

pET28-SBP Vector

Source	Constructed by Farrell MacKenzie
Company	Structural Genomics Consortium, Toronto
Description	pET28-SBP is an <i>E. coli</i> expression vector derived from vector pET28-MHL (SGC) and has a T7 promoter that drives expression of recombinant proteins with the addition of an N-terminal 6xHis-tag and SBP-tag. Two stop codons are included in the vector at the C-terminal cloning site.
Antibiotic resistance	Kanamycin
Promoter	T7 - lacO
Cloning Methods	Insertion of a DNA sequence into the cloning/expression region is performed using Clontech's In-fusion enzyme-mediated directional recombination between complementary 15 nucleotide DNA sequences at the ends of the insert (PCR product) and BseRI linearized vector. Insertion of a target sequence involves replacement of a SacB gene stuffer sequence, which provides for negative selection of the original plasmid on 5% sucrose.
